Recommendations

- **Improve patient flow and reduce wait times** by reviewing admission scheduling, staffing levels, and resource allocation at branches with consistently long waiting periods
- **Optimize resource utilization** by balancing bed occupancy, doctor workloads, and departmental capacity to reduce operational bottlenecks and improve service delivery..
- **Strengthen quality of care** by monitoring departments with high readmission rates and lower recovery scores, implementing targeted clinical improvement initiatives where necessary.
- **Enhance financial performance** by closely tracking treatment costs, improving cost efficiency in high-expense departments, and adopting best practices from the most profitable branches.
- **Leverage performance benchmarking** across hospital branches to identify high-performing facilities and replicate successful operational and clinical practices throughout the network.
- **Institutionalize executive performance monitoring** through an interactive dashboard that provides real-time visibility into clinical, operational, and financial KPIs, enabling faster, data-driven decision-making.

Thank You!
